- In depth learning of the computer architecture.
- Basic programming language learning, C, Java, Python, HTML/CSS/JavaScript, MySql
- Game development using unreal engine.
- Website building using PHP/WordPress and development in Xampp.

Field of study Software Engineer

PROJECTS

13/03/2025 – CURRENT
Express JS authentication

- The project is built in Node.JS, using NPM as the package manager it will serve as a basic example of a login/register page, emphasizing a world with minimal framework usage.
- The project uses express js to serve static HTML pages that send login/register api requests to the server, and build said api routes.

- Packages that are used are, bcrypt for password hashing ensuring security and privacy, body-parser for facilitated parsing of incoming request bodies, better-sqlite3 for my project's database and storing user info, ejs for dynamic display and possibly more dynamic data in the future.
- Security measures taken into account for user input, in HTML, users are able to remove "required" from login/register fields resulting in server-side errors.

30/05/2024 – CURRENT
Visual Basic ATM Simulator

- The project is built in Visual Studio using Visual basic to serve an application for the windows operating system.
- Is evolved around Newtonsoft JSON to store user data (login, register, amount of cash).
- The user can create an account and login to an existing account.
- Functionality of withdrawal and deposit of cash in the user's account, the data will be saved and dependent on only the user.
